2. Overall Description 5

1. Introduction

AlBuraqPilgrim system is a holistic and committed system that is meant to handle, coordinate and maximize all Hajj and Umrah related activities to the pilgrims and the travel agencies. Pilgrimage is an important spiritual activity that needs proper information, good planning, and coordination hence, an effective management system is crucial in making sure that the whole exercise is smooth and efficient. AlBuraqPilgrim is a complex, digital tool that can be used to handle typical issues encountered in the process of packages choice, booking, processing documents, trip organization, communication, and service management. The platform also reinforces the communication gap between pilgrims and travel agents by ensuring live updates, notifications, automated guidance, and a customized dashboard to the users and the administrators. It is also user-friendly to allow pilgrims manage their bookings, upload documents, get guidance and track their progress, and travel agencies can conveniently handle a variety of customers, keep records, and track the general workflow. AlBuraqPilgrim has an opportunity to offer a streamlined and improved digital pilgrimage experience through being transparent, scalable, and aligned with the requirements of contemporary pilgrimage travel processes to Hajj and Umrah.

1.1 Purpose

AlBuraqPilgrim is a web based platform created with the aim of digitalization and modernization of Hajj and Umrah management services. This system is aimed at automating and streamlining end-to-end process of the pilgrims and travel agents through providing centralized access to package information, bookings, payment processing, document submissions and guided pilgrimage services. This will aid in accuracy, promptness of communication and effective management of all activities associated with the preparation and execution of pilgrimage.

This document is focused on the entire AlBuraqPilgrim system and gives a clear picture of the key requirements that should be considered in the development and implementation of the system. All the key components of the system are emphasized in the SRS, such as user authentication, package browsing, booking management, documentation workflow, dashboards, notifications, and payment integration, as well as service communication tools. This document will have both functional and non-functional requirements, thus enabling all stakeholders to obtain the correct picture of the system structure and functionality to develop, evaluate, and maintain it.

1.2 Document Conventions

The document conventions applied to the AlBuraqPilgrim SRS have guaranteed readability, consistency and clarity of the text in terms of size since, the major text font used is Times New Roman, size 12 that provides the document with a professional look. The main headings are bold, are styled as Heading 1 and have font size of 16 with all sub-headings using Heading 2 style with font size 13. Headings have a minimum of 6pt of pre-spacing and 12pt after-spacing and paragraph line spacing is 1.5 to enhance readability. To achieve uniformity all through the document, as well as, to emphasize the emphasis and priority of each requirement within the entire system, the functional requirements have their identification format, these are structured conventions that ensures the use of the document is effective in the development life cycle as the reader and system developers understand the structure of the requirements and how to classify the requirements.

1.3 Intended Audience and Reading Suggestions

- **Developers:** Concentrate on system architecture, requirements, workflows, backend logic, APIs, and implementation constraints.
- **Users (Pilgrims and Travel Agents):** Be familiar with the platform features, services, and booking processes, and the way the system satisfies the needs of users. Users are supposed to start with the features of the system as well as user interface.
- **Documentation Writers:** The SRS can be used to create user manuals and guides based on what is written in this document: features, workflows and user interaction.
- **Project Managers:** Go through scope, objectives, milestones, and constraints with emphasis on planning and resource allocation.
- **Testers / QA Engineers:** Read the requirements of expected functionalities, acceptance criteria, and performance requirements to formulate suitable test cases.
- **Stakeholders / Agencies:** Understand the benefits of the system, outcomes, and value presented by the platform to the management of Hajj and Umrah services.

1.4 Product Scope

AlBuraqPilgrim is designed to reshape the conventional process of workflow Hajj and Umrah services so it could be organized, contemporary, and technologically oriented. The system is

supposed to streamline all the necessary functions, such as exploration of packages, booking requests, payment, submitting of documents, access of Ziyarat information, and communication between pilgrims and travel agencies. The core goal is to offer a centralized, transparent and user friendly platform that facilitates the pilgrims as well as the service providers. Via the systems, pilgrims will be able to monitor their booking, be guided, provide documentation, and get information related to the traveling, whereas travel agencies will be efficient in managing numerous clients, service requests, and ensuring that the information is processed on time. The most important functions that are integrated in AlBuraqPilgrim to improve the general efficiency level include automated notification systems, monitor-based dashboard, communication tools, and guided resources, which are used to reduce the distance between the users and service providers. Finally, AlBuraqPilgrim underpins the vision of enhancing customer experience, not wasting time and effort, and facilitating the arrangement of pilgrimage and efficient management according to the modern travel service demands.

2. Overall Description

2.1 Product Perspective

AlBuraq Pilgrim is a tailor-made, stand-alone web-based system that is created to substitute manual and disintegrated operations of traditional travel agencies. The system will give a common platform on which pilgrims, travel agents, administrators, and users of the AI chatbot can carry out booking, documentation, travel advice, and tracking of journeys. The system will be interconnected with external payment APIs and AI services and, possibly, third-party APIs of flights and hotels. It can be accessed via any of the current web browsers and no further software is needed. The portal will provide safe access and coordinated data transactions and interactions among users, agents, and administrators.

Modules

- Public Website
- User Dashboard
- Admin Dashboard
- AI Chatbot Module
- Document Processing Module

- Booking & Payment Module
- Ziyarat Map Module

Technology Stack

- Frontend
- Backend
- Database
- AI Services
- Payment Gateways

2.1.1 Dependencies on Third-Party Software

- **Node.js:** Request processing and server-side programming.
- **React.js and Tailwind CSS:** Dynamic and responsive, styled user interface.
- **MongoDB:** Protected storage of user and travel information.
- **External Payment APIs (Stripe, PayPal):** Secure online payments.
- **AI Services (OpenAI APIs):** Chatbot support and guidance.
- **Web Browsers:** Chrome, Edge, Firefox, Safari.

2.1.2 Limitations of the Proposed System

- **Internet Dependency:** It needs constant internet to access and operate.
- **Third-Party Service Dependency:** Payment and AI APIs should be accessible.
- **Future Expansion:** Flight and hotel integrations rely on third-party travel APIs.
- **Technical Knowledge:** There are those users who might be required to be guided through the platform.
- **Device Dependency:** The best on the latest browsers; the mobile app will add mobile features (e.g., GPS position) in the future.

2.2 Product Functions

Public Website Functions: The Public Website allows the visitors to know the main information about the company and the services it offers, to explore pilgrimage packages, and to see Ziyarat sites on the interactive map. It also offers Hajj and Umrah instructions, frequently asked questions, contact information, and secure logins and registration to users.

User Dashboard Functions: The User Dashboard enables the pilgrims to manage its profiles, upload travel documents, book, modify, or cancel packages and monitor their booking status. It facilitates safe online payments and allows one to access all uploaded documents at a single location. Users are also able to provide experiences and see their progress on the way traveling to Ziyarat to its end.

Admin Dashboard Functions: Admin Dashboard enables administrators to handle travel package, user accounts and bookings and upload user-specific documents and control shared user stories. It also allows them to update the journey statuses of pilgrims and create invoices and reports to ensure effective records keeping.

Additional Features: Other functionality is provided by an interactive Ziyarat map, a chat bot based on artificial intelligence, and built-in payment systems with automated alerts. New developments will involve mobile-based GPS positioning in order to track journeys in real time.

2.3 User Classes and Characteristics

2.3.1 Primary Users

Pilgrims / Regular Users: Pilgrims have very poor to average technical awareness and utilize the system to book packages, to manage their travel, to get guidance, to upload documentation required and to make safe payments.

Admin / Travel Agent: The administrators are more knowledgeable technically and domain wise and deal with all pilgrims and bookings, change journey statuses, document upload, and user stories.

2.3.2 Secondary Users

Super Admin (Future Role): The Super Admin manages various agencies, and has control over the permissions of users, global system settings and integrations of services.

AI Chatbot Users: The users of the AI chatbot are any person who needs to be guided and communicates with the system using texts, voice, or speech-to-text.

2.4 Operating Environment

AlBuraq Pilgrim system functions within a safe, reachable, and structured setting aimed at fulfilling server and client demands. The server-side can be hosted on regular web servers or cloud providers and can be configured with Node.js backend services and MongoDB as the database, whereas the frontend is developed with React.js, Tailwind CSS and React Router to create a responsive and easy-to-use interface. It uses OpenAI APIs to integrate AI-powered features and allows payment via Stripe, PayPal, or local gateways. Access to the portal is possible on the device, equipped with a steady internet connection, using the latest web browsers like Chrome, Edge, Firefox, or Safari, and in the future, it would also be possible to access the portal through mobile apps, which will work with GPS-based tracking of the journey. Security is achieved by providing the HTTPS communication, the use of the encryption of the message using the SSL/TLS, the role-based access control, and frequent backup and disaster recovery measures. Such an arrangement enables the pilgrims to browse packages, handle their booking, upload documents, and monitor their journey in a convenient, trustworthy, and secure way, and administration and agents to easily manage users, packages, and system functions.

2.5 Design and Implementation Constraints

It is developed based on React.js, Node.js, and MongoDB and has the backend functionality on REST API. It uses JWT authentication and bcrypt to manage passwords and process payments in accordance to the PCI guidelines. The end-users have the option to post documents in PDF, JPG, and PNG formats, and AI capabilities are based on third-party APIs. The future development of mobile apps will be based on the React Native to make it cross-platform.

2.6 User Documentation

The AlBuraq Pilgrim system is equipped with a number of resources to adjust the users and guarantee the successful functioning. These consist of a detailed user manual presented in PDF format, a system administrator training manual available in the PDF format, and a help or frequently asked questions section online that allows one to get quick help. Moreover, the AI chatbot provides stepwise guidance on frequently used tasks and questions and means that users

can seek real-time help. The combination of these resources will make sure that everyone, pilgrims and administrators, will be able to navigate the system and use it properly.

2.7 Assumptions and Dependencies

The AlBuraq Pilgrim system presupposes a constant stable internet access of the users. It depends on administrators to post correct and confirmed documents.

Paying gateway accounts must be active to be able to carry out transactions. AI services should be available to get real-time support and help. The system presupposes that the data on Ziyarat locations is verified and verified. The availability of the MongoDB database to store the data is a determinant of functionality. Secure transactions require the use of external payment APIs, such as Stripe, PayPal, and local gateways.

There has to be third-party AI services available like OpenAI in order to offer support to chatbots. It needs a solid cloud storage service, such as Vercel or AWS, to ensure that the site is online. The system equally relies on the current web browser compatibility and future mobile GPS services to have features improved.

3. External Interface Requirements

3.1 User Interfaces

The Smart AI Hajj and Umrah Platform is based on the principles of modern and user-interested design and is designed in a responsive framework and can be used on both mobile and tablet computers as well as desktop ones. The interface is engineered to be efficient, user-friendly and smooth.

General UI Standards

- Modern clean and consistent React.js/Tailwind CSS layout.
- Fixed top navigation (Home, Packages, Ziyarat, Guidance, Services, Login) across all pages.
- Contact information, quick links and social media icons in footer on each page.
- Forms with labeled fields, placeholders, real-time validation, and error messages.
- Normal buttons: Login, Register, Book Now, Submit, Upload Documents, Pay Now.

- AI chatbot icon present at the bottom-right at all times.
- The error messages are in red, the success messages are in green.

Public Website UI

- Home page, hero banner, service overview, quick links, testimonials, featured packages.
- About Us page, the company background, mission, vision and images.
- Services page with Flights, Hotels, Transport, eSIM.
- Packages page where all packages are displayed and have a button to view details.
- Page package details, where there is the price, itinerary, inclusions/exclusions, and button Book Package.
- Ziyarat Map page with interactive pins and places list.
- Guidance page to step by step instructions on Hajj and Umrah rituals.
- FAQ page with the collapsible questions and answers.
- Contact Us form, map, phone numbers, email, and address.
- Policies section on privacy, terms and refund policies.

User Dashboard UI

- Sidebar modules: Profile, My Bookings, Documents, Payments, Stories, Track Journey.
- Booking list status badges (Pending, Approved, Completed, Cancelled)
- Drag-and-drop document upload area.
- Invoice download/print payment history.
- Supporting text, image, and video uploads on a story submission page.
- Journey tracking module with a timeline (Departure → Arrival → Umrah → Ziyarat)

Admin Dashboard UI

- Sidebar modules: Packages, Users, Bookings, Documents, Stories, Tracking
- CRUD forms for packages
- User, booking and payment viewing tables.
- User specific document upload panel (Visa, Ticket, Hotel Voucher)
- Approve/Reject screen on the story moderation screen.
- Status update panel of journey tracking.

AI Chatbot UI

- It has a fixed chat at the bottom-right.
- Text and microphone entry.
- User and AI chat bubbles.
- Buttons: Send, Retry, Clear Chat
- Switched language (enhanced later)

3.2 Hardware Interfaces

The platform is designed as a service that is provided on the Internet however, physical requirements are provided to optimise performance.

End-User Devices:

- Smartphones (Android and iPhone), tablets, laptops, and desktops.
- A minimum of 2 GB of RAM is recommended to ensure smooth operation.
- Some requirements have to be fulfilled for the chatbot to perform its voice input functionality.

Server Hardware

- Cloud or access hosting compatible with the Node.js runtime, a MongoDB database and communications with AI APIs
- A secure SSL/TLS certificate for secure (HTTPS) communications

Future Mobile App Hardware

- Real time location tracking via GPS
- Permission to access the device's location (for journey tracking)

3.3 Software Interfaces

Internal Interfaces

- Frontend <-> Backend API: Communication using Rest style along with requests & responses in the format of the laid out structures of the language used to define the request & response (here, application/json.

- Endpoints that are dedicated for authentication, bookings, documents, payments and stories
- Backend <-> Database: Mongo DB using collections like Users, Bookings, Packages, Documents, Payments, Stories, and Ziyarat Points CRUD operations are handled with Mongoose (Object-Data Mapper)

External Interfaces

- Payment Gateways: Stripe, Payal, or a local Pakistani gateway for secure transactions, all of which require API keys
- AI Chatbot API: Integration with OpenAI or similar models with text and voice transcription capabilities
- Email / Notification APIs: To send confirmations, alerts, and reminders (e.g., Nodemailer, Twilio, SendGrid) Ziyarat locations visualisation: Google Maps or Leaflet JS

User Authentication

- A JWT-based authentication system
- Login and registration forms
- Tokens stored in the form of so-called cookies in the data stream of the http protocol

3.4 Communications Interfaces

The system incorporates standard protocols and secure communication channels:

Network Protocols

- Using of Host protocol (HTTP/HTTPS) for all web communications
- It is mandatory for Payment, Upload of documents, authentication and Artificial intelligence communicating

  Data Formats
- Client-server interactions using the following: - JSON
- Part/form-data - Multipart/form-data for file uploads

  The Real-Time Communication (future scope):
- WebSockets for live tracking & chat

Email Communication

- SMTP for registration confirmations, payment receipts, bookings updates

Security & Encryption

- TLS/SSL encryption for all data exchanges
- Password hashing-Password Hashing using bcrypt
- JWT tokens for secure access control

Performance Requirements

- API responses: 1–3 seconds
- Document uploads: up to 10 MB
- AI chatbot responses: 1-5 seconds

4. System Features

4.1 User Authentication & Account Management

4.1.1 Description and Priority

The current feature will allow pilgrims and administrators to safely register and authenticate their accounts. It guarantees that every user has a secured access to the platform and personal data security. This high-priority feature is because this forms the basis of system security and controlled access.

4.1.2 Stimulus/Response Sequences

User Registration

- The user has to fill personal information, the system check in the input, create an account, and show a confirmation message.

User Login

- User enters email and password, credentials are verified and a JWT token issued and the user redirected into the dashboard.

4.1.3 Functional Requirements

- **REQ-FR-001:** The users will be allowed to create their accounts using email, password and name.

- **REQ-FR-002:** Register All required fields will be validated.
- **REQ-FR-003:** Bcrypt shall be used to encrypt the passwords.
- **REQ-FR-004:** Users will have the ability to log in using valid credentials.
- **REQ-FR-005:** After successful login, jwt token will be provided for the session.
- **REQ-FR-006:** System is not going to allow access to secured routes without proper authentication.
- **REQ-FR-007:** System will provide the possibility to log out and invalidate tokens.

4.2 Booking & Payment System

4.2.1 Description and Priority

Through this module pilgrims are allowed to view and reserve Hajj and Umrah packages and book extra services including flights, hotels, transport, and eSIM packages. After making bookings, customers can easily pay using built in gateways. All packages, service request and payment confirmations are handled by administrators to maintain accurate information and smooth processing. The module is high-priority because it represents the very essence of the platform its functionality, making it possible to plan a trip and coordinate financial transactions.

4.2.2 Stimulus/Response Sequences

- The system allows user to see all available options by visiting the Packages or Services page.
- User clicks "View Details" and the system would show his or her itinerary, price, inclusions, and pictures in full.
- The user clicks Book Package or orders a service and the booking is stored in user dashboard as pending.
- Once the user clicks Pay Now, the system will redirect to the chosen payment gateway and the payment is processed successfully, and an invoice is generated and saved.
- Admin gives a notification, approves, rejects or updates the status of the booking/service, the system in its turn changes the dashboard and informs the user.

4.2.3 Functional Requirements

- REQ-FR-001: The user will be in a position to see all packages and services.
- REQ-FR-002: The user will be able to reserve the packages and other services.
- REQ-FR-003: Bookings or other service requests will be in the state of Pending before it is confirmed.
  REQ-FR-004: The users will be able to edit or cancel until the bookings or service request is confirmed.
- REQ-FR-005: When creating a new package booking or service request admins shall be notified.
- REQ-FR-006: Admins will accept, reject, or change bookings and service requests status.
- REQ-FR-007: Admins will be capable of creating, updating, and deleting packages.
- REQ -FR-008: System will alert users whenever the status of any booking or service request is changed.
- REQ-FR-009: System will be able to connect Stripe, PayPal or local gateways, to offer secure payment, ability.
- REQFr010: System will be required to support card and wallet.
- REQ-FR-011: System will create downloadable invoices on payment
- REQ-FR-012: The records of transactions will be contained in the user dashboard.

4.3 Document Upload & Management

4.3.1 Description and Priority

Users and administrators will be in a position to upload and process key documents like passports, visas, tickets, CNICs, receipts, vouchers. This is a high-priority requirement that will lead to compliance and ease of travelling.

4.3.2 Stimulus/Response Sequences

- User uploads passport, the system saves the document and a preview is shown.
- The user is informed with the notification of Admin uploading the visa, and the visa is available to download or print.

4.3.3 Functional Requirements

- **REQ-FR-001:** The users will upload the required documents.
- **REQ-FR-002:** Admins will upload the documents to users (visa, tickets, vouchers).
- **REQ-FR-003:** All the documents will be associated with the appropriate user.
- **REQ-FR-004:** The users will be able to obtain documents and print them.
- **REQ-FR-005:** System will inform users when document is uploaded by an admin.

4.4 AI Chatbot with Voice & Multilingual Support

4.4.1 Description and Priority

AI assistant provides responses to pilgrimage, bookings, documents, and navigation queries. Improving user support, high-priority.

4.4.2 Stimulus/Response Sequences

- User will type or speak and AI will respond either in text or speech.

4.4.3 Functional Requirements

- **REQ-FR-001:** Chatbot will be available on every page.
- **REQ-FR-002:** Deal with text and voice queries.
- **REQ-FR-003:** Chatbot will communicate with user in text form.
- **REQ-FR-004:** The system also support input via speech to text.
- **REQ-FR-005 (Future):** Support multiple languages for conversations.

4.5 User Journey Tracking System

4.5.1 Description and Priority

The admins are able to change a user pilgrimage status and it will be displayed in real time on dashboards. This medium level feature increases transparency.

4.5.2 Stimulus/Response Sequences

- The system receives the update through the Admin, but the update is saved and the updated journey progress is displayed to the user.

4.5.3 Functional Requirements

- **REQ-FR-001:** User progress monitoring: Not Started, Departure, Arrival, Umrah, Ziyarat, Completed.
- **REQ-FR-002:** Phase 1 With Phase 1, Admin will update progress manually.
- **REQ-FR-003 (Future):** User will be tracked from mobile application using GPS.

4.6 Story / Experience Sharing

4.6.1 Description and Priority

People can post pilgrimage stories, in the form of text, photographs, and videos. This is a medium priority feature, which improves interaction and socialization.

4.6.2 Stimulus/Response Sequences

- Story is posted, awaited to be moderated, approved by the administrator and it is publicly available.

4.6.3 Functional Requirements

- **REQ-FR-001:** The end users will be required to upload stories (texts, images, videos).
- **REQ-FR-002:** The stories will be stored under the user dashboard.
- **REQ-FR-003:** Admin will accept or reject the submissions.
- **REQ-FR-004:** The valid stories would be published on the public “Client Stories” page.

5. Other Nonfunctional Requirements

5.1 Performance Requirements

AlBuraq Pilgrim system is designed to provide smooth and responsive experience even in case there is high user traffic. The system ensures that all web pages are completely loaded in 2-4 seconds based on the normal conditions of the network, with dashboard data which is rendered in

3 seconds after user authentication. The artificial-intelligence chatbot communication response takes 1-5 seconds and is reliant on the API response time as well, meaning continued direction to the user. Phase 1 shall comprise of the support capacity of at least 1,000 simultaneous users on the platform as a result of which the architecture features scalability to add several travel agencies during further developments. The database can handle at least 100,000 records, the records can be users, bookings, documents, and stories and document upload is 10 MB a document. The system has quick speeds even when the number of bookings and capacity of uploaded documents are high. The payment processing is designed to look at a duration of 5-8 seconds of completion with redirection and confirmation at the gateway hence guaranteeing a responsive and dependable user-friendly experience in-between the platform.

5.2 Safety Requirements

Safety and reliability are also vital elements of the AlBuraq Pilgrim system where vital data about the users is properly protected and also ensures that it operates without disruption. Ms. bakery also uses back-ups of data every day to avoid loss of data in case of crash or failure of the system, which is facilitated by the platform. Transactional safeguards are applied in critical processes to ensure that duplications, corruption, and incomplete operation of various processes and operations are avoided through transactions. The system is also built with a graceful approach of showing user-friendly messages and processing invalid input without failure. The interaction of artificial intelligence chatbot is controlled to avoid production of harmful or misleading content, and the speech-to-text functions are activated only with the express consent of the user giving access to the microphone. Further, payment confirmation is done successfully upon receipt of validated payments made by the payment gateways thus making the transactions safe and reliable.

5.3 Security Requirements

The AlBuraq Pilgrim system is very sensitive to security as the information about the users is sensitive such as passport and CNIC numbers, personal documents, and money related part. The platform uses authentication based on the use of JWT with the access control based on roles so that only users with privileges can access certain dashboards and the features of the system. Passwords of the user are hashed safely by the use of the bcrypt hash function with efficient salting character and all the interaction between the server and the client is encrypted with the help of

HTTPS with the application of TLS encryption. Confidential files are kept in sensitive and controlled directories and only the users can access their files with system administration restricted to authorized personnel. As a security measure to counter typical cyber attacks, all the system inputs are sanitized to exclude injection attacks, cross site scripting, and cross site request forgery. Moreover, payment processing is made according to the security standards of PCI-DSS, and no crude credit-card data is stored in the system, which guarantees the high data protection and integrity of the system.

5.4 Software Quality Attributes

The design of the AlBuraq Pilgrim platform will ensure high levels of usability, reliability, availability, scalability, portability, and interoperability to ensure long term performance and subsequent growth. The system provides mobile-friendly and easy to use interface allowing pilgrims to navigate functionalities regardless of the screen size and provides easy access to the Ziyarat map, including well-defined markers and descriptions. Constantly updated database is used to ensure high reliability of system operations where as availability is performed at a target of 99 to ensure access at all instances of high Hajj and Umrah seasons with a well defined maintenance mode in case of need. The site is based on a well-organized codebase on React and Node.js controllers as well as RESTful APIs that make upgrades and maintenance easier. It is also compatible with any modern web browsing client, and can be implemented on the bewildering array of cloud platforms. Moreover, the system will have the capability of scale due to the regular additions to accommodate additional growth function like connecting with other travel agencies and the smooth connectivity of the third-party systems, including payment gateways, AI, and mapping APIs.

5.5 Business Rules

The AlBuraq Pilgrim system is governed by several rules of business in order to maintain the proper administration, security, and adherence to the organizational policies. Bookings are never finalized before the payment process has been successfully completed; no user is allowed to cancel bookings after being approved by an administrator with the refunds being offered in strict compliance with the cancellation policy in place in the company. Administrators will upload the mandatory travel documents after booking approval, like visa, tickets and hotel vouchers and users

after final confirmation are obligated to submit the necessary documents such as passport copies, CNICs, and photographs. Stories or other experiences posted by users should be examined and approved by administrators prior to being published, and the administrators have the right to take down any piece of content that the administrators consider as inappropriate or harmful. To avoid misinformation, the AI chatbot is strictly forbidden to issue a religious fatwa or legal and medical advice. At the beginning stage, the administrators will have the possibility to change the status of a user in his journey, and GPS-tracking functions will be working only in case a user gives his/her consent. Besides, authenticated administrators only can change travel packages or booking statuses and this helps keep the system intact and safe.
